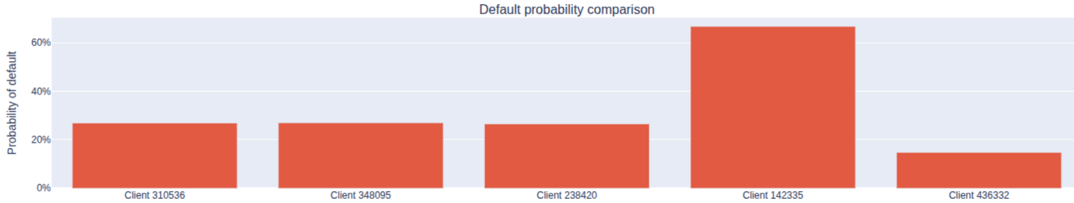
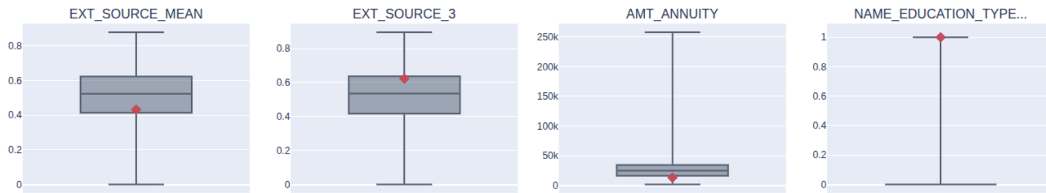
Default probability comparison



- comparison between this client and other clients



Brief explanation (local interpretability)

This client received a **low probability of default (26.91%)**, so the model predicted **TARGET = 0 (no default)**.

Based on the client's profile shown in the Plotly visuals, the model is likely seeing a **generally strong repayment profile** (signals typically associated with *lower* default risk, such as **solid income capacity vs. expenses**, **manageable debt burden**, and/or **good past repayment/credit behavior** if those variables are present in your data sources). These factors collectively keep the predicted risk **low**, resulting in a **non-default** outcome.
