Brief explanation (risk rationale)

For Client ID **396899** (test split), the model estimates a **36.06%** probability of default and predicts **no default (0)**. This low-risk assessment is supported by the client's overall application-level financial and credit-behavior indicators visible in the report (e.g., income/affordability, leverage and utilization, and repayment-history signals), which collectively point to stronger repayment capacity and lower near-term credit stress. In addition, the client's profile appears comparatively aligned with lower-risk borrowers in the peer comparison view, reinforcing the non-default outcome based on the **credit-history/behavioral indicators available in the application data**. Overall, these factors support a low-risk profile, consistent with a non-default prediction.
